

Conventional Spreadsheet

This screenshot shows a traditional application (not using dsC) displaying the current data set as originally presented in a spreadsheet.

We include this example to show several lacunae in spreadsheet applications' functionality that can be improved by using a customized Dataset Application. The following screenshots will highlight three limitations in particular:

- The spreadsheet does not store information in a format amenable to reuse by other projects or by production deployments of the author's method. By contrast, the dsC version models all data as standalone, cross-platform C++ classes that can be reused for any new project.
- The spreadsheet does not have an obvious mechanism for researching individual modeling elements. For instance, there is no explanation near the column labels "WithFlow" or "Against" which explain what these parameters mean and how they are used.
- The spreadsheet will not be suitable for large-scale or commercial deployment. For example, the touchscreen interface to a device monitoring airflow needs a UI specific to its cyberphysical data — it is not feasible for medical devices to run spreadsheet software!
- The spreadsheet groups all statistical parameters (i.e., column headers) together, without representing their internal organization. For example, the spreadsheet does not structurally distinguish between raw cyberphysical inputs, intermediate calculated values, and the important computed values which the cyberphysical system is designed to produce. In this case, as the original article explains, Oxygenated air flow and Oxygen concentration levels are the significant derived values, and the research presents a method for computing these values given a specific cyberphysical and algorithmic setup.

Using a “tree widget” (a two-layer spreadsheet), instead of a conventional spreadsheet, allows the Dataset Application to distinguish primary values (those measured directly by physical devices and experimental equipment) from intermediate values calculated via algorithms.

As shown in this screenshot, the primary values are visible in tabular form for each sample. One sample at a time is then expanded (1) – signaled via the primary values changing to red (2) – which reveals the secondary values associated with that sample (3).

Using Dataset Applications as Pedagogical Tools

In addition to interactive visualization, Dataset Applications are useful tools for understanding experimental protocols and research methods. Within Dataset Applications, modeling units such as statistical parameters and record fields are visible in situ within a GUI — identified by labels, buttons, and other interactive micro-controls. As a result, users encounter modeling elements in a structured visual-interactive context. To learn more about modeling elements, Dataset Applications are equipped with several pedagogical features shown on the following screenshots:

“About” Dialogs Brief summaries of research terms and parameters.

XPDF Links Link back to research articles read in an embedded PDF viewer.

XPDF Enhancements The XPDF viewer can be customized for each data set and included with dataset code, with extra features to integrate article or book texts with Dataset Applications.

More (PDF) ... Cancel Hide Details...

The Flow measurements calculate the flow of oxygenated air (as needed for Continuous Positive Airway Pressure (CPAP) devices) given inputs of ambient temperature and sound time travel. The third (nested) row beneath the Flow value shows each sample's Flow 'rank' (where lower ranks mean that a sample has less Flow; the rank #1 is the sample with least flow). The second nested value shows each sample's flow measurement as a fraction of the maximum measurement

[Screenshot](#)

In this example — which logically follows the dialog box shown on the preceding screenshot — after viewing a short description of a particular data field inside the Dataset Application, researchers have the option of studying that parameter further by reading at the location in the original text where the field has been introduced or described. This is possible because the XPDF viewer is compiled as an *embedded application* within the main Dataset Application and can itself be customized for each data set.

The screenshot shows the XpdfReader application window. The title bar reads 'XpdfReader: /'. The menu bar includes 'File', 'Edit', 'View', 'Window', and 'Help'. The status bar at the bottom indicates '2 of 21'. The document content is titled 'WILEY-Expert Systems' and discusses the speed of sound in air. A red box highlights the text, and a red circle with the number '1' is placed over the 'WILEY-Expert Systems' header.

2 of 21

WILEY-Expert Systems

because we know that air is a relatively fixed mixture of gases, primarily consisting of nitrogen, oxygen, argon, and carbon dioxide, that in varying amounts of water vapour or humidity. The speed of sound in air is approximately 343 m/s at room temperature (20 °C or 70 °F). This is primarily a function of temperature; the only other factor that has any effect on the speed of sound in air is the amount of humidity in. However, humidity has only a slight influence; an increase in the amount of humidity in the air increases the speed of sound by only a small amount. Humidity can vary greatly, but because the amount of change of speed with an extreme change in humidity is less than 0.5%, we can conclude the speed of sound is usually measured in dry air, neglecting the effect of humidity. We also realize that pressure is not a factor because experiments have shown that changes in air pressure have no real effect on the speed of sound. It is also well known that sound travels slower at altitudes. This is because the temperature and relative humidity are lower and not because the air pressure is lower at higher altitudes. Therefore we can calculate the speed of sound in dry air in metres per second (m/s) as being approximately equal to $v = 331.4 + 0.6TC$ m/s, where v is the speed or velocity of sound and TC is the temperature in degrees Celsius. For example, if $TC = 0$ °C, then $v = 331.4 + 0 = 331.4$ m/s. Similarly, if $TC = 20$ °C, then $v = 331.4 + 0.6 * 20 = 331.4 + 12 = 343.4$ m/s. These equations also demonstrate that as the temperature of air goes up, the speed of sound goes up concurrently.

Tools for Editors and Developers

Although ordinary users can explore and visualize dsC data sets “Out of the Box,” more advanced users have many options for customizing their build of the application in terms of their academic or editorial roles and available third-party code libraries. These fine-tuning possibilities include:

Test Suites Tools for creating and/or running test suites to ensure that the Dataset Application works across platforms.

Data Export Tools for reusing data in other projects.

External Libraries Some features like XPDF and 3D graphics require libraries which are external dependencies (they cannot be published in source code form within the data set code). Advanced users can select which of these libraries to incorporate into their version of the Dataset Application.

Scripting Data sets can compile their own scripting environment to automate testing and manipulation of research data.

Networking Dataset Applications can use an embedded TCP server to communicate with other applications, enabling multi-application workflows (this is also how testing is implemented).

Datasets Compiled From Book Examples

The remaining screenshots demonstrate how data sets can be used even outside the context of generating experimental data. The pictured data set represents a corpus of linguistic examples mined from Wiley's *Blackwell Handbook of Pragmatics*. Creating data sets from book-length publications can encompass several steps:

Text Mining In the case of linguistics, this involves locating example sentences within linguistics texts and storing them as an independent corpus.

Canonical Formatting If possible, linguistics texts should be formatted with markup allowing examples to be extracted automatically. This has the added benefit of ensuring that the dataset software can link between individual samples and their location in the book text.

Annotation Linguistic corpora are often annotated to identify structural details, beyond raw text, in each sample.

Tree Widget

This screenshot shows a linguistics dataset that illustrates several advanced interactive features made possible by the Dataset Creator's Qt-based front-end technology. Useful features include context menus embedded with drop-down selections (1) and button/checkbox groups for filtered scrolling through a list of samples (2 and 3).

from the matched spaces to create a **blended mental space** with emergent structure. This creates a conceptual integration network of the form shown in figure 29.4. The generic space represents the structure shared by the inputs. The square in the blended space stands here for the emergent structure which arises in the blending.

So, for example, one way to understand the counterfactual in (6):

(6) In France, Watergate wouldn't have done Nixon any harm.

is to build a conceptual integration network that partially matches two input spaces with prominent aspects of the American political system and the French political system, respectively, and develops an emergent blended space

Figure 29.4 Diagram showing conceptual blending

Tools to Facilitate Annotating Linguistic Corpora

The final three screenshots show an example of how a custom-designed application can facilitate the task of building an annotated corpus from a linguistics text. The components demonstrated here enable several strategies (which can be combined) for describing parsing structures and the logical forms ascribed to language samples:

S-Expressions Representing linguistic units as semantic and syntactic transformations triggered by words assigned to “functional” (lexical or Part of Speech) types.

Dependency Grammar Representing phrase structures via inter-word syntactic relationships.

Link Grammar Representing linguistic structure via connectors internal to each word-sense — inter-word links are activated when each word in the pair has a connector compatible with the other word’s connector. Intuitively, connectors represent how one word’s meaning or grammatical contribution can be “completed” by the phenomenon of its linking to another word.

Tree Widget

The list of link/dependency relations is also isolated as a “dock widget” that may be dragged to float above the other application windows (1), or “docked” at different positions (left or right) on its parent window. This screenshot also shows a dialog box used for a précis of the individual CoNLL-U (Conference on Natural Language Learning - Universal) and Link Grammar relations (2).

3 {3}	at least				

As an additional feature of the components shown on the last two screenshots, users can select word-pairs from samples being annotated and then identify the relationship between the selected words, as understood according to Link or Dependency Grammars. The list of link/dependency relations provides an interface to research and read overviews about the relationships.

A3R Document Viewers

A3R applications may embed viewers for document formats such as e-Pub, HTML, and PDF; then supplement conventional publications with special components customized for individual manuscripts: e.g. (as in this case), a widget allowing readers to visually explore patterns in classical Indian music.

The screenshot displays the A3R Document Viewer interface. On the left, a sidebar contains navigation links: 'Preferences', 'Library', and 'Reading'. Below these are tabs for 'HTML Source', 'Lisp', 'CSS', and 'XML'. A red horizontal bar is visible. The main content area shows a blue link 'd article view' and an orange icon. Overlaid on the right is a 'Display Tala Types' window. This window has a dropdown menu set to 'Jhoomra/Dhamar (14 beats)'. It features a visualization of a 14-beat tala pattern, represented by a grid of red and green boxes. Below the grid is a 'Patterns' section with a slider for 'Pattern 1 (3-4-3-4)' and 'Pattern 2'. At the bottom, a 'File' field shows the path '/extension/ScignSeer/articles/svg/tala.svg'. Buttons for 'OK' and 'Proceed' are at the bottom right.

A3R Document Viewers as Embedded Components

Document Viewers may also be embedded in host applications which provide domain-specific visualization capabilities. For example, chemistry papers might be viewed within IQmol (a Qt-based program for molecular visualization and physical/chemical analysis) via an A3R document-viewer plugin.

The screenshot displays the IQmol software interface. At the top is a menu bar with 'Display', 'Build', 'Calculation', 'SONIC', and 'Help'. Below it is a toolbar with various icons for file operations, editing, and visualization. A context menu is open over the 3D molecular model, listing options such as 'Configure', 'Select All', 'Reperceive Bonds', 'Duplicate Geometry', 'Atomic Charges', 'Remove', and 'SONIC'. The 'SONIC' option is highlighted, and a sub-menu is visible showing 'Springer Keyword Search: Cysteine', 'Springer Web Search Home', and 'Search Saved Articles'. In the background, a 3D ball-and-stick model of a molecule is shown, featuring a large yellow sphere (sulfur), a large blue sphere (nitrogen), and several smaller white (hydrogen) and red (oxygen) spheres. An embedded window titled 'Springer' displays search results for 'Cysteine'. The window shows 'Showing 157 results.' and lists a book titled 'Cysteine Proteases of Pathogenic Organisms' edited by Robinson, M. W. (Ed) and Dalton, J. P. (Ed) (2011). The book cover is visible next to the title. The URL at the bottom of the browser window is 'www.springer.com/gp/search?query=cysteine&submit=Submit'.

Document Viewers Augmented With APIs

Another strategy for interactive publications is linking documents with APIs maintained by publishers, or by cultural or educational institutions.

View

Instructions

As an example, documents mentioning artifacts held in a museum can provide features to view more information about those museum-pieces through the host institution's API.

Embedded Multimedia

Custom-built A3R document viewers can provide convenient access to multimedia content embedded in or linked to texts — including audio files, videos, and 3D graphics scenes or models.

Ailurus fulgens styani (also known as *A. f. refulgens*). Only found in China (in the Hengdian

In this case a video player is launched in a dialog box, floating above the article text. For those reading digital books or articles, videos and other multimedia content can be presented through secondary windows launched via context menus; text and multimedia may thereby be viewed side-by-side.

Behavior

Red pandas are generally solitary, but there are a couple of exceptions. They develop extended associations with their mothers that last through the breeding season.

In terms of behavior, red pandas tend to have a more solitary lifestyle than other species. This may be due to their search for the most suitable habitat, which is typically distributed in a fragmented manner.
