

Advances in Data Modeling and Text Mining for Covid-19 Research

Amy Neustein

Nathaniel Christen

Approx 250 pages, 15 chapters

Manuscript Submission Date: August 31, 2020

1. Table of Contents

Foreword (Invited)

Authors' Introduction

Part I: Architecting Data Models for Scientific Disciplines Associated with Covid-19

- Chapter 1: Data Structures for Molecular Biology and Virology
- Chapter 2: How Genomic Data is Stored and Analyzed in the Coronavirus Context
- Chapter 3: Structuring of Radiographic and Diagnostic Data in the Context of Covid-19
- Chapter 4: Reviewing Epidemiological Structures and Methodology for SARS-Cov-2 Research
- Chapter 5: Modeling Clinical Data in the Covid-19 Patient Population

Part II: Creating a Cross-Disciplinary Ecosystem for Covid-19

- Chapter 6: Approaches for Merging Heterogeneous Data Sets: Ontologies and Hypergraphs
- Chapter 7: Scientific Workflows and Inter-Application Networking: Reviewing data pipelines commonly used in Covid-19 research
- Chapter 8: Formal Procedural Models: Representing computational procedures applicable to Covid-19
- Chapter 9: Integrating Procedural and Data Models
- Chapter 10: Type Theories for Procedural Data Modeling

Part III: Text and Data Mining for Covid-19

- Chapter 11: Applying Data Mining Techniques to Covid-19 Research Corpora
- Chapter 12: Text Mining of Covid-19 Publication Archives
- Chapter 13: Human-Computer Interaction Approaches for Covid-19 Software
- Chapter 14: Using Text-Mining Tools to Extract Medical History from Clinical Narratives
- Chapter 15: Annotating Patient Narratives for Emerging Covid-19 Symptomatology
