

The NCN/A3R (“NA3”)

Native Application Development Framework

Linguistic Technology Systems (LTS)

Amy Neustein, Ph.D., Founder and CEO

amy.neustein@verizon.net

(917) 817-2184

Team Members

Lead Software Architect

Nathaniel Christen, Doctoral Candidate, University of Ottawa. Specializations: C++, Programming Language Implementation, Cognitive and Computational Linguistics, Scientific Computing, Philosophy of Science, Digital Humanities.

Quality Assurance and User Acceptance Consultant

Ara Mehetarian, former head of Quality Assurance at Random House and AIG.

Medical Imaging and Data Communications Consultant

Alan H. Rowberg, M.D., formerly RIS/PACS Manager at Northwest Hospital; Co-Developer of DICOM protocol formerly Co-Chair of DICOM Standards Committee.

Company Founder and CEO

Amy Neustein, Ph.D., Editor-in-Chief of the *International Journal of Speech Technology*; Editor of De Gruyter Series in Text Mining in Medicine and Health Care; Editor of SpringerBriefs in Speech Technology; Author/Editor of 12 academic books on natural language processing, speech recognition, text mining, speech and automata, forensic speaker recognition, mobile speech, and cyber-physical systems and smart homes.

Capital Raising for Round A, ROI, and Exit Plan

- ◆ New Jersey-based home-grown female-headed software development company launching “Round A” between \$1.5 and \$2 million.
- ◆ Conservative burn with 5 year exit plan.
- ◆ Company valuation at \$100 Million at exit. ¹
- ◆ Business model: customization, hosting, and licensing. ²

¹ See Slide 11 for development stages and exit strategy.

² See Slides 9 and 12 for details.

Our NCN (Native Cloud/Native) Protocol

Cloud/Native Components as Back-Ends for Native Software

- Our “Native Cloud/Native” protocol refers to native application front-ends paired with Cloud/Native (back-end) container instances.
- Code libraries and data representation may be shared across both endpoints.
- Common representation on both server- and client-side streamlines network communications (no need to marshal data between different formats).
- The NA3 technology can be ported to other application frameworks apart from Qt (wxWidgets, XCode, MFC, etc.).
 - Note: This presentation will focus on NA3’s default Qt implementation.

How Cloud Back-Ends Enhance Native Front Ends

- Cloud Backup ● Share Data between Users ● Collaborative Editing
- Maintain users’ application state across different computers (home/school/office)
- Upgrade running applications without needing to re-compile

How NCN Addresses Limitations of Qt in the Cloud

Qt is the most popular native, cross-platform application-development framework.

- ◆ ~1 million active developers
- ◆ Over 5,000 client companies
- ◆ Worldwide “Qt Partners” Ecosystem
- ◆ ~US \$25 billion overall market

However, there is Limited Qt Cloud Integration Support

- “Qt Cloud Services” Discontinued in 2016.
- Currently there is no standard model for accessing Cloud services from Qt applications.
- Nor is there a standard Qt-based Cloud/Native container architecture.

How NCN Addresses Limitations of the Semantic Web

Many experts have critiqued the Semantic Web for lacking conceptual rigor, adequate modeling for multi-scale information, and intrinsic representations for Quality Assurance Requirements. To address these limitations, NCN introduces new Semantic Web technologies with the following features:

The Application-as-a-Resource (A3R) Model

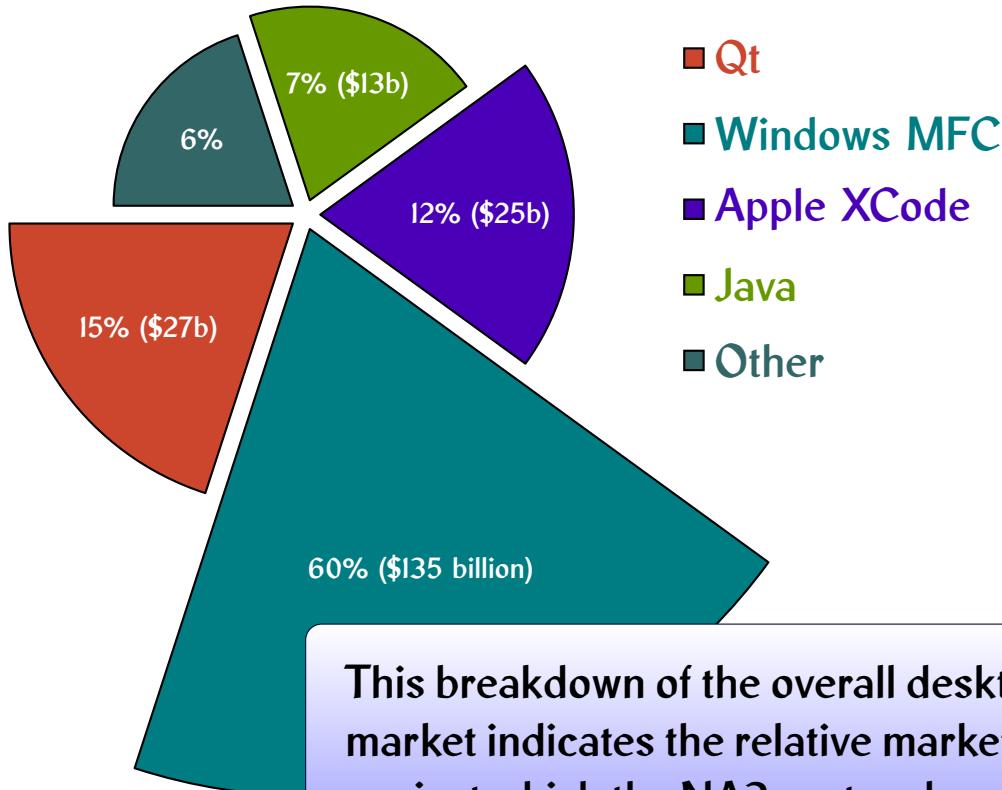

- A3R Applications are self-contained, citable resources which can conform to modern resource documentation standards, such as the Research Object protocol.
- A3R includes a representation for natural language publications (e.g., books and articles) that unifies different manuscript formats (such as XML, \LaTeX , and XCONCUR).

Multiscale, Requirements-Focused Resource Description

- NA3 incorporates Semantic Web alternatives with greater Requirements Engineering and Quality Assurance precision, such as Conceptual Space Markup Language.
- Hypergraph-based Resource Framework to intrinsically support multi-scale data structures.
- Workflow-oriented “Meta-Procedure” Interface Definition framework to enforce procedural alignment among applications.

Overview of the Software Development Market

This slide offers a rough breakdown of the software development market, (estimated at \$350 Billion), restricted to desktop software (roughly one-half the total market), including both cross-platform and single-platform solutions.

Taking the Qt implementations of the NCN and A3R protocols as a prototype, analogous versions may be built targeting other popular software-development platforms (see next slide for a more detailed outline).

This breakdown of the overall desktop application-development market indicates the relative market share of different platforms against which the NA3 protocols may be implemented.

Our NCN Business Strategy

Within the Qt Market

- Promote NCN as a standard solution for Qt/Cloud Integration.
- Promote NCN developer tools for custom Qt scripting/markup languages.
- Promote NCN's Semantic Web protocol as a standard model for inter-application networking, describing applications, and serializing application-specific data structures.
- On the basis of these enhancements to the Qt ecosystem, LTS hopes to join the **Qt partners** program, which would expose NCN's unique features to a worldwide developer community.

Outside of Qt (see slide 9)

- Port the NCN Protocol implementations, C++ reflection model, and hypergraph libraries to standard (non-Qt) C++ and other languages.
- Implement language-agnostic hypergraph serialization to allow NCN networking between applications written for different operating systems and/or programming languages.

NCN Revenue Sources

- ◆ **Customization** Custom-implemented applications using project-specific versions of NCN and/or A3R (see slide 12).
- ◆ **Licensing** Commercial licenses required for any deployment of NCN outside LTS-controlled servers and/or any commercial deployment of A3R applications.
- ◆ **Hosting** Running proprietary containers via a Cloud-Native service such as OpenShift, LTS can offer integrated hosting and consulting wherein LTS fully implements and maintains a back-end paired to any desktop/native client software. (Because the expertise involved in building native desktop applications is very different from the techniques required to deploy a Cloud-Native container image, the option of delegating all backend responsibilities to LTS may appeal to Qt-oriented development teams.)
- ◆ **Sponsorship** Running a data-sharing platform which would be a publicly-visible introduction to NCN. This “demo” container would host research data sets (and would therefore be a resource in the public interest) allowing LTS to receive compensation from companies financially supporting the portal because it is a technology which benefits science and research.

Baselines For Projecting LTS Growth

This slide considers sample Qt-based companies to establish a baseline for assessing the future growth of LTS.

- ◆ **The Qt Group Plc** *€45.6 Million annual revenue* (source: Qt) Financial records released by The Qt Group suggest that commercial “Developer” and “Distribution” licenses are Qt’s largest revenues source: Qt aims for 60% revenue from licenses, 20% from consulting, and 20% for “support and maintenance” — total net revenue across these sources was US \$57 Million.
- ◆ **ICS (Integrated Computer Solutions)** *US \$25-50 Million annual revenue* (source: Glassdoor) ICS specializes in custom software development for companies in the military, aeronautics, and biomedical sectors. ICS exemplifies a Qt company whose revenue derives mostly from customization and consultation.
- ◆ **Toradex** *US \$16.2 Million annual revenue* (source: owler.com) Toradex specializes in microprocessors and embedded systems, one of the largest of several Qt partners focusing on embedded systems with Qt front-ends for touchscreens and/or desktop consoles.

ROI and Development Phases

- I (9-12 mos) Establish a hosting platform (projected to take the form of a RedHat Enterprise Service or Kamatera Partner affiliation) within which LTS can license individual cloud back-ends on a per-client basis, paired with clients' desktop front-ends. We will make tools available to help developers create applications that leverage NCN back-ends, including those hosted by our company.
- II (1-2 yrs) LTS will prioritize marketing its development libraries and cloud service, with an emphasis on explaining to Qt-based companies that the LTS hosting option provides functionality similar to the discontinued Qt Cloud Services.
- III (2-4 yrs) Generalize NA3 to standard C++ (eliminating Qt dependencies), implement NA3 in an Apple-specific version targeting XCode, port NA3 to Java, and build a Windows-specific implementation via MFC.
- IV (Fifth yr exit) With NA3 now realized in Qt, Windows, Mac, and Java versions, consolidate each of these implementations into canonical container prototypes, such as RedHat "Cartridges". This collection then becomes a comprehensive, multi-platform desktop/cloud integration technology valued at \$100M.

Customization and Monetization

■ All development and licensing figures quoted are per-client

- ◆ **Custom NCN Servers** LTS builds special versions of NCN which natively recognize client's application-specific data types, preferred serialization formats, and client/server interface definitions.
(dev: \$75K; licensing: \$10K/month)
- ◆ **Custom Markup and Scripting Languages** LTS builds scripting and/or markup languages customized for clients' unique data and interface requirements. These custom languages may be used for data serialization, testing, prototyping, and runtime fine-tuning of application behavior.
(dev: \$250K; licensing: \$10K/month)
- ◆ **Custom GUI Components** LTS builds GUI classes on client's behalf, which natively support NCN integration. (dev: \$50K; licensing: \$5K/month)
- ◆ **Workflow Management** LTS customizes networking protocols so that multiple applications may be unified into distributed workflows.
(dev: \$50K; licensing: \$15K/month)

NA3 In Different Software Ecosystems

Potential NA3 Markets (see Slide 7 for overview)

Windows MFC (~\$135b market size) NA3 components can be implemented in MFC (Microsoft Foundation Classes) and C++/CLI, building off of a generic-C++ version using the C++ Standard Library in place of Qt-specific data structures.

Apple XCode (~\$25b market size) Apple Operating Systems are based on Linux, so Linux-oriented A3R implementations can form the basis of an XCode version. This XCode implementation would also be built around the C++ Standard Library.

JavaFX (~\$12.5b market size) The Java programming language provides the most widely used cross-platform application development framework outside of Qt. It is feasible to port C++ NA3 implementations to Java. The core of this re-implementation would involve designing a Java Hypergraph Library compatible with the A3R serialization and Interface Definition protocol.

Workflow Management (~\$10b market size – source: MarketsandMarkets) NA3 plugins can be added to new or existing applications to support inter-application networking, unifying multiple applications into workflow-management systems.

Example Use-Cases

Inter-Application Networking and Workflow Management

- Export data and instructions between Qt-based applications (slides 15-16).
- Embed document or multi-media viewers inside scientific or dataset applications (slides 27-30).

Responsive desktop-style applications for enhanced UX

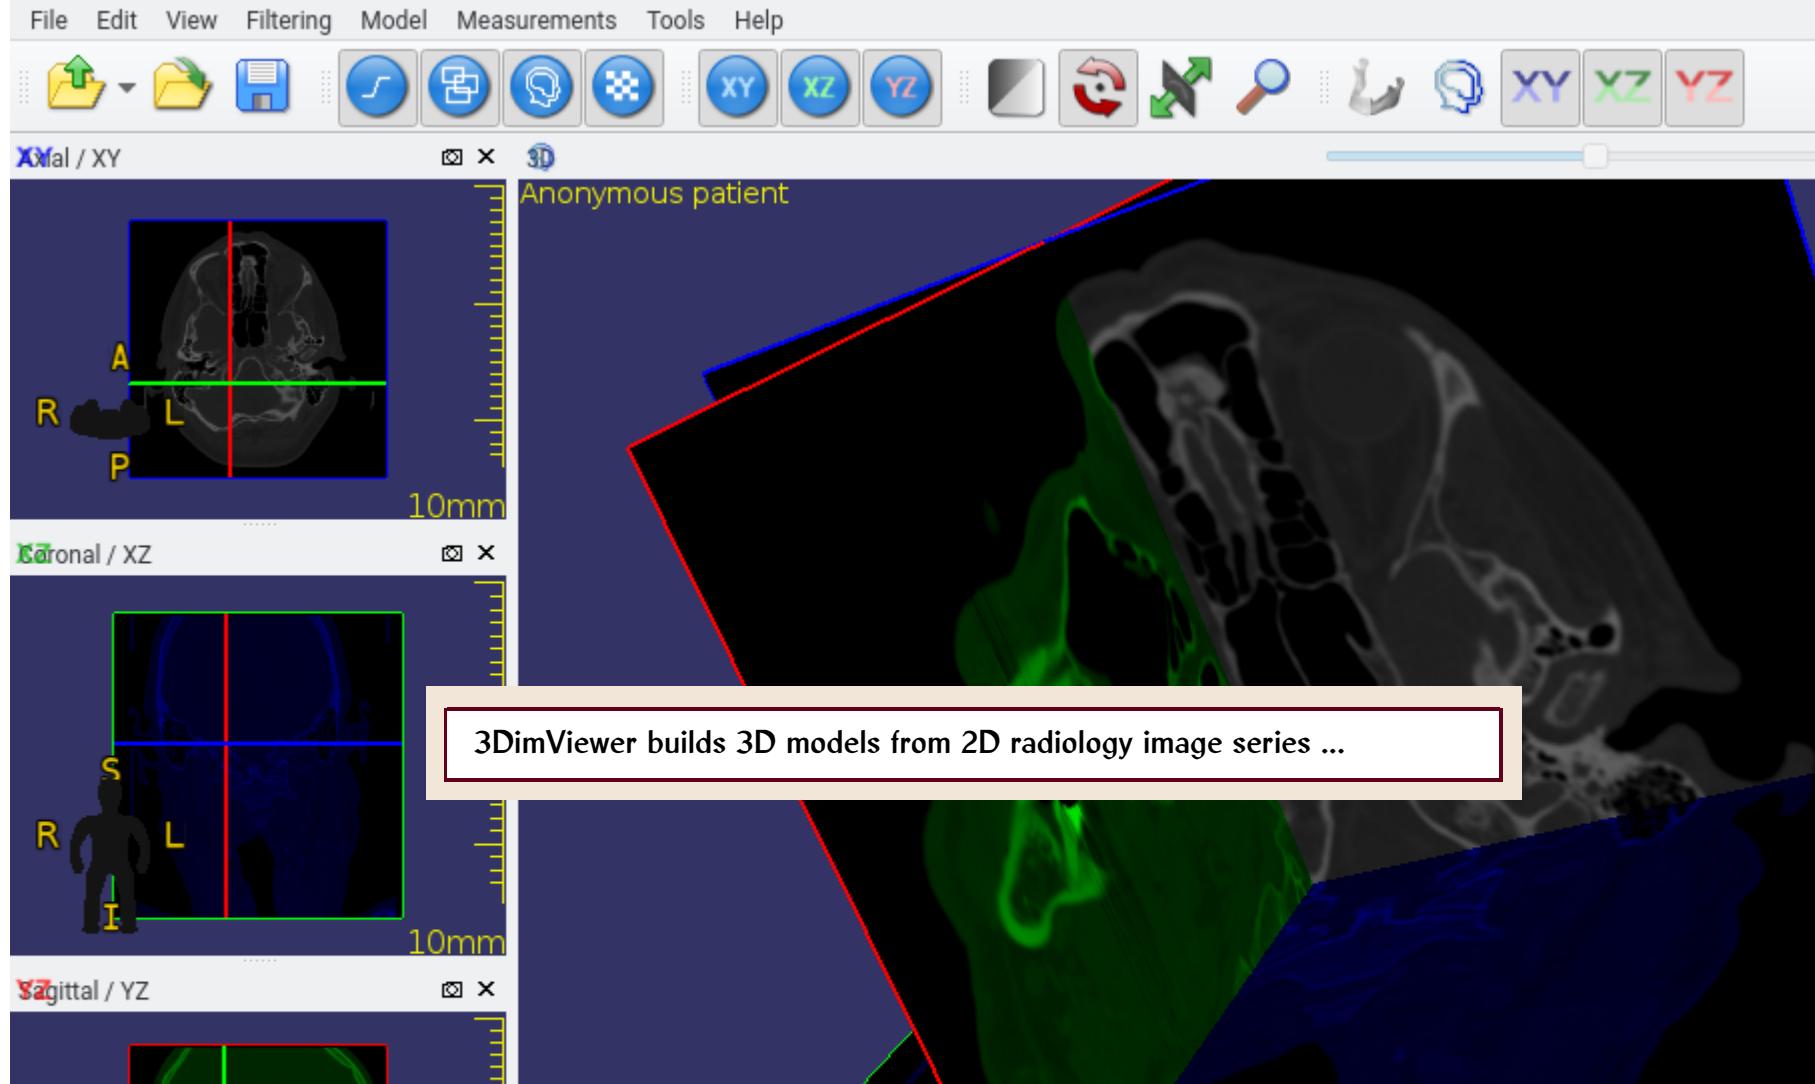

Native applications offer superior User Experience, leveraging distinct interactive features of desktop GUIs: context menus, dialog boxes, tool tips, Multiple Window Display, dock windows, and so on:

- Compelling front-ends for e-commerce (Note: “46% of global online retail orders happen on desktop”, source: lefronic.com), Real Estate, VR, etc. (slides 20-26).
- For scientists and researchers, build innovative data-collection instruments as well as interactive Research Object applications (slides 17-19).

An Example of Inter-Application Networking

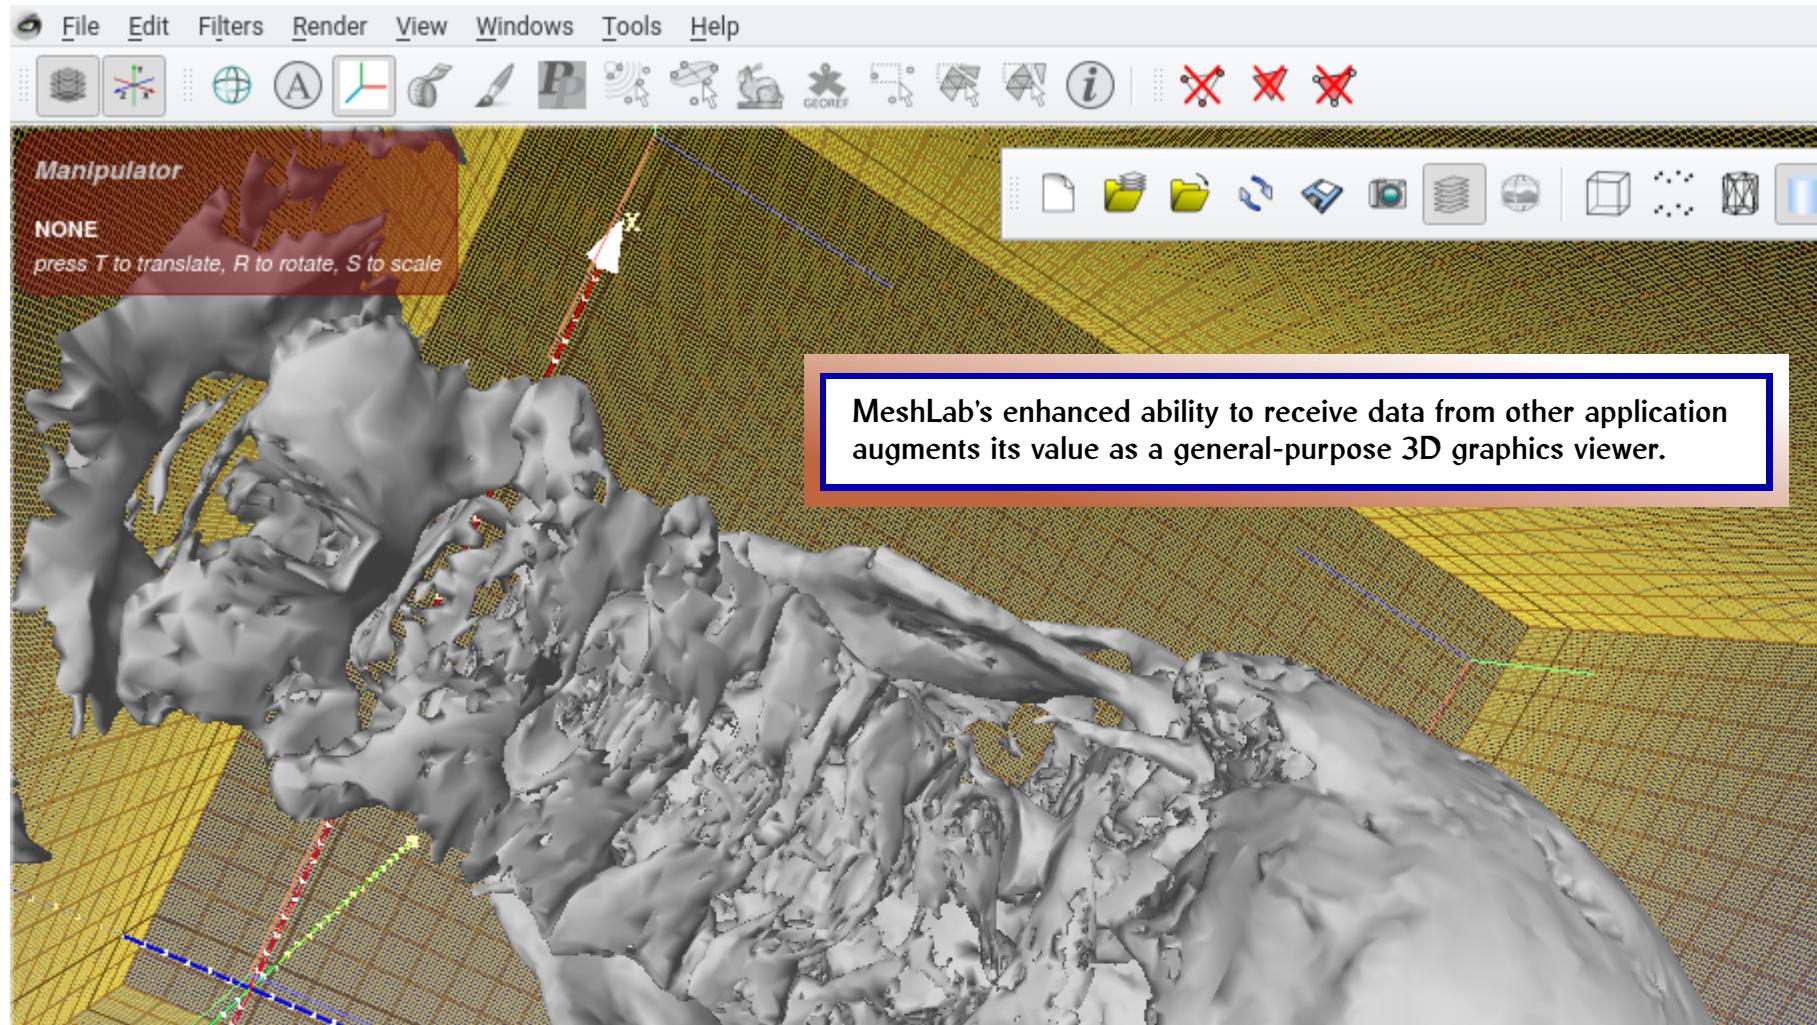

Research S
Research Slide 2
Research Slide 3
Research Slide 4
Research Slide 5

This slide and the next demonstrate a case-study where inter-application data sharing enhances the capabilities of two applications: 3DimViewer (a radiology tool) and MeshLab (a 3D graphics engine).

3D Graphics Sent to MeshLab

... Once the 3D tissue sample is constructed by 3DimViewer's algorithms, an A3R inter-application networking protocol (implemented as an extension to both applications) allows 3DimViewer to export the model to MeshLab so that it may be studied in a more comprehensive 3D viewing environment.

A screenshot of a medical data collection application. The interface includes a top navigation bar with 'Forms', 'Web', 'Language', 'Help', and 'About' buttons. Below the navigation is a toolbar with 'Save Form', 'Open Form', 'Cloud Save', 'Cloud Open', and 'Submit Form' buttons. A search bar and a 'Forwards' button are also present. On the left, a 'Form Outline' sidebar lists sections: 'Welcome' (selected), 'Web', 'X', '?', '^', 'X', 'Form Outline', and a note 'Click on a subheading to continue'. Below this are buttons for 'Patient Information', 'Chief Complaint', 'Review of Symptoms', 'Treatment History', 'Medical History', 'Current Medications', and 'Family History'. A central modal window titled 'ndp-main-outline <5>' contains fields for 'Referring Doctor' (Dr. New Test) and 'Referred By (Choose One)' (Clinical Specialist). It also has a 'Date of Visit' field set to '1/9/16' and a 'Please List your Previous Stays' section with a calendar. The calendar shows dates from January 2018, with specific entries 'Test 2' on Jan 14 and 'Test 1' on Jan 21. Buttons for 'OK' and 'Print' are at the bottom of the modal.

In medicine and social science, “data collection instruments” (DCIs) refer to surveys, questionnaires, and other tools to obtain human feedback.

As a case-study in enhanced User Experience afforded by native applications, consider how static PDF catalogs and brochures can be turbo-charged into engaging, interactive software-based presentations.

The screenshot shows a native application interface for a shoe catalog. The main area displays a brown leather high-top sneaker with a white sole, resting on a blue surface. A context menu is open over the shoe, with the 'Detach Everything' option highlighted in blue. To the left, a sidebar shows thumbnail images of other shoes. At the bottom, there are navigation buttons for item selection and image zoom, along with tabs for 'Overview', 'Features', 'Specs', and 'Reviews'. A list of product features is visible at the bottom left. To the right, a detailed product description for the 'Grand Crosscourt II Sneaker' is shown, including a description, actions (Add to Cart, Explore Colors), and color swatches.

Interactive Shopping Carts

Instead of static lists, shopping carts can be made into multi-dimensional, multiple-window interactive displays.

The image shows a screenshot of a software application interface, likely a shopping cart or catalog system, demonstrating a multi-dimensional, multi-window interactive display. The interface includes a top navigation bar with links for File, Email, Events, APIs, Web, and Broadleaf. Below the navigation is a toolbar with a 'Page' dropdown set to 0, a 'Search for:' field, and a 'Document' dropdown set to 100%. The main area features two overlapping windows, each titled 'tecs-db-main <2>' and 'tecs-db-main <3>'. The left window displays a purple peony bouquet with the following product details: 'Lily Garden Silk Peony Bouquet Home Decoration, Lilac, 18 Inches High'. The right window displays a large arrangement of purple hydrangea flowers with the following product details: 'Frosted Hydrangea, Mauve, 32 Inches High, 12 Floral Sprays'. Each window has an 'Overview', 'Specs', 'Reviews', and 'Q & A' tab at the bottom, with the 'Overview' tab selected. At the bottom of the interface are 'OK' and 'Cancel' buttons.

Explore Products with Native Software

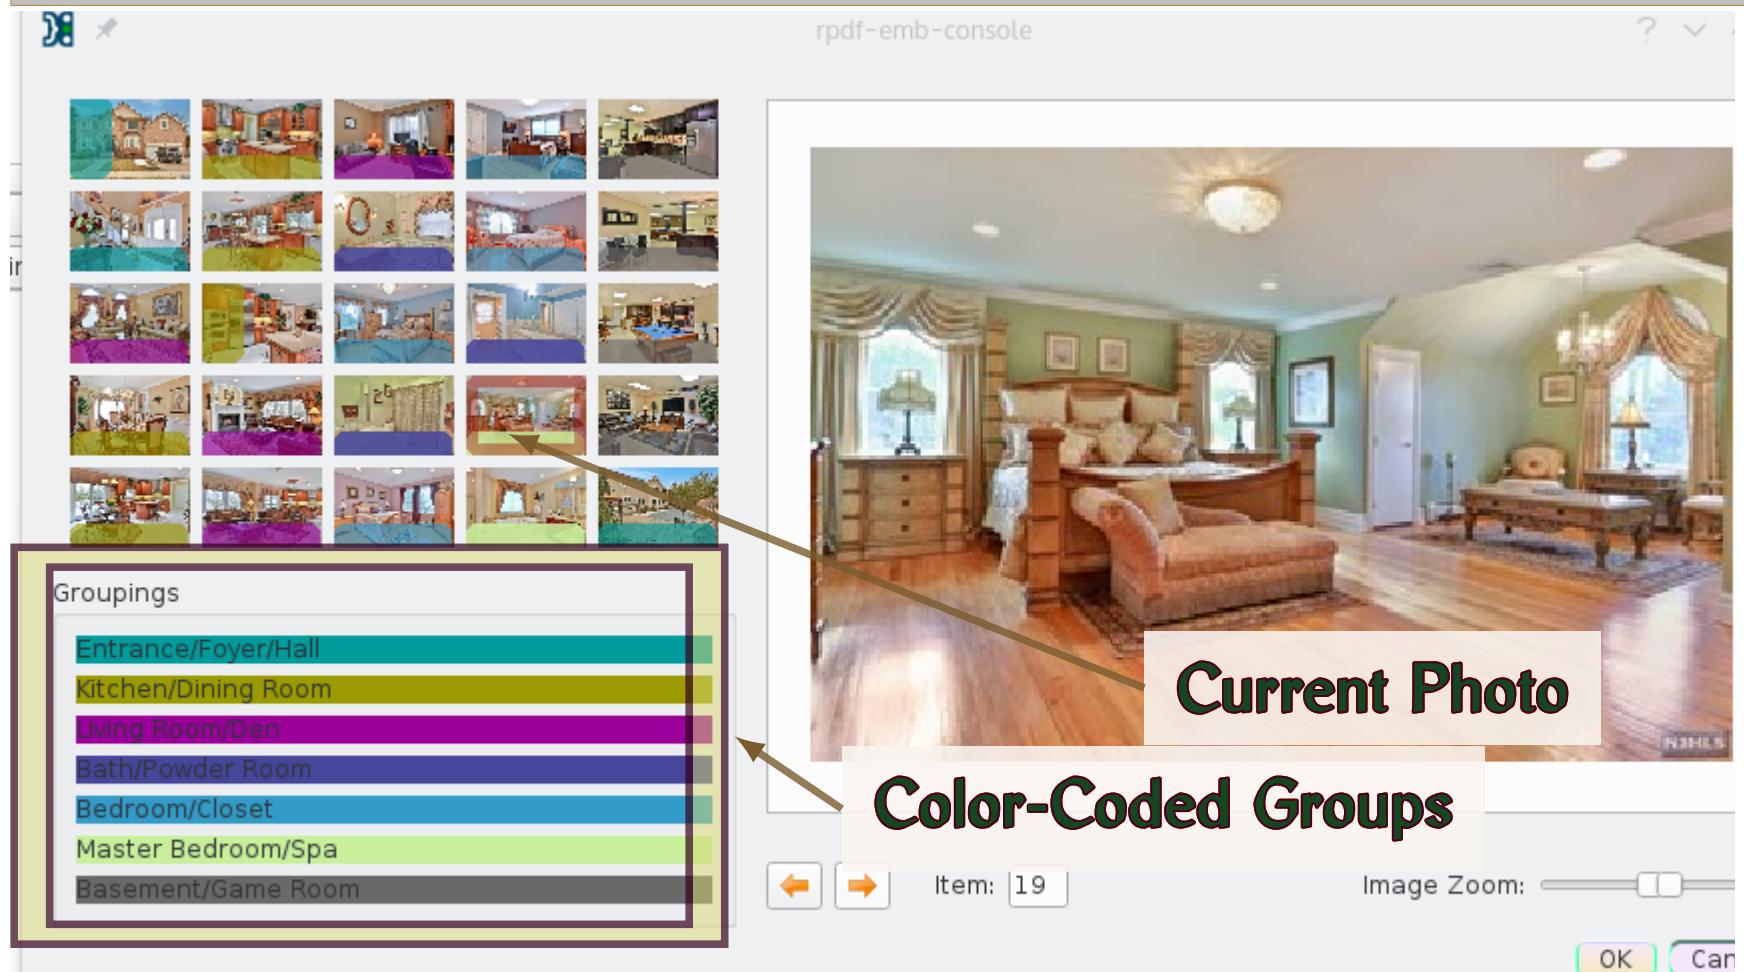

Interactive catalogs allow designers to incorporate many unique features and capabilities of desktop applications, such as using HSV color-wheel controls to explore color coordination while shopping.

A3R programming can also bring enhanced UX to Real Estate presentations: instead of just groups of photos, properties can be displayed via interactive, multi-dimensionally organized, color-coded photo viewers.

The screenshot shows a software interface for viewing real estate photos. On the left, a grid of thumbnail images represents different property types. On the right, a large image of a bedroom is displayed, with a callout box labeled "Current Photo". At the bottom left, a "Groupings" panel lists categories with color-coded bars: Entrance/Foyer/Hall (teal), Kitchen/Dining Room (olive green), Living Room/Den (purple), Bath/Powder Room (dark blue), Bedroom/Closet (blue), Master Bedroom/Spa (light green), and Basement/Game Room (grey). Arrows point from the "Groupings" panel to the "Current Photo" image and the "Color-Coded Groups" text. The interface includes navigation buttons, an item counter (Item: 19), an image zoom slider, and standard window controls (OK, Cancel) at the bottom right.

Photo Viewer Interactive Cues

These slides demonstrate visual cues aiding photo navigation, such as color bands (overlays) that switch from horizontal to vertical indicating which photos have been viewed so far; and the thumbnail of the current viewed photo marked with a thick colored border (surrounding the thumbnail photo and its overlays).

The screenshot shows a photo viewer interface with a grid of thumbnail images. A large, detailed image of a living room is displayed on the right. On the left, a sidebar shows 'Groupings' with categories: Entrance/Foyer/Hall (teal bar), Kitchen/Dining Room (yellow bar), Living Room/Den (purple bar), Bath/Powder Room (dark blue bar), Bedroom/Closet (light blue bar), Master Bedroom/Spa (light green bar), and Basement/Game Room (grey bar). The 'Kitchen/Dining Room' grouping is currently selected. Three arrows point to specific elements: one from the text 'Already Viewed (vertical color band)' to a thumbnail with a vertical purple border; one from 'Not Yet Viewed (horizontal color band)' to a thumbnail with a horizontal teal border; and one from 'Current Photo (viewed for the second time)' to the large, detailed image of the living room.

Filtering Photos

Another feature which may be conveniently implemented in A3R-style photo viewers is a filtering option, which — given a collection of pictures classified into several groups — allows users to show or hide photos based on the group they belong to (note the check-box buttons on the group listing).

The image shows a photo viewer interface with a sidebar of thumbnail images and a main content area displaying a living room. The sidebar includes a 'Groupings' section with several checkboxes. A green oval highlights the 'Entrance/Foyer/Hall' checkbox, which is checked. A red oval highlights the 'Basement/Game Room' checkbox, which is unchecked. Arrows point from the text labels 'Visible Groups' and 'Hidden Groups' to the respective green and red ovals. The main content area shows a well-decorated living room with a large painting, a sofa, and a coffee table.

Interactive VR: Hyperlinked Tag Posts

Another emerging technology, relevant to both e-Commerce and Real Estate, is the use of Panoramic Photography to create immersive Virtual Reality scenes. Panorama-Photography-based VR engines, like Matterport, allow “tag posts” with embedded hyperlinks, which in a native-application context become channels of communication between the VR renderer and the host application. The full capabilities of this interactive modality — combining VR with clickable links and text “bubbles” — can only be fully realized via Virtual Reality engines (such as WebGL) embedded in native software.

A3R Document Viewers

A3R applications may embed viewers for document formats such as e-Pub, HTML, and PDF; then supplement conventional publications with special components customized for individual manuscripts: e.g. (as in this case), a widget allowing readers to visually explore patterns in classical Indian music.

The screenshot shows a digital journal interface. At the top, there are three icons: a gear, a book, and a magnifying glass. Below the icons are three buttons: 'References', 'Library', and 'Reading'. A horizontal menu bar follows, with buttons for 'HTML Source', 'Lisp', 'CSS', and 'XML'. A large red rectangular area covers the main content area. Below this, the text 'Read article view' is visible. At the bottom, there is a small icon of a person in a red and orange outfit.

The screenshot shows a visualization interface for 'Tala Types'. At the top, a dropdown menu says 'Display Tala Types: Jhoomra/Dhamar (14 beats)'. Below this is a large rectangular area containing a grid of colored rectangles. The top row is red, and the bottom row is green. Between them is a purple row with some segments missing. Below this grid, the word 'Patterns' is followed by a slider with 'Pattern 1 (3-4-3-4)' on the left and 'Pattern 2' on the right. A file path 'File /extension/ScignSeer/articles/svg/tala.svg' is shown. At the bottom right, there is a 'Proceed' button.

A3R Document Viewers as Embedded Components

Document Viewers may also be embedded in host applications which provide domain-specific visualization capabilities. For example, chemistry papers might be viewed within IQmol (a Qt-based program for molecular visualization and physical/chemical analysis) via an A3R document-viewer plugin.

The screenshot shows a chemistry application interface. At the top is a menu bar with 'Display', 'Build', 'Calculation', 'SONIC', and 'Help'. Below the menu is a toolbar with various icons. A 3D molecular model of cysteine is displayed, showing carbon (grey), hydrogen (white), oxygen (red), and sulfur (yellow) atoms. On the left, a sidebar for 'SONIC Reader' is open, showing a search interface for 'Springer Keyword Search: Cysteine'. The sidebar includes buttons for 'Configure', 'Select All', 'Reperceive Bonds', 'Duplicate Geometry', 'Atomic Charges', 'Remove', and 'SONIC'. Below the sidebar, the Springer logo is visible. The main search results area shows 'Showing 157 results.' for 'Cysteine Proteases of Pathogenic Organisms' by M. W. Robinson and J. P. Dalton (Eds.) from 2011. The results list includes the book title, authors, and a brief description: 'Cysteine proteases expressed by pathogenic organisms play key roles in virulence including host'. At the bottom, a URL is provided: www.springer.com/gp/search?query=cysteine&submit=Submit. The bottom right corner of the application window shows a set of small control icons.

Document Viewers Augmented With APIs

Another strategy for interactive publications is linking documents with APIs maintained by publishers, or by cultural or educational institutions.

View Instructions

As an example, documents mentioning artifacts held in a museum can provide features to view more information about those museum-pieces through the host institution's API.

Behavior

Red pandas are generally solitary, but there are a couple of cases where they develop extended associations with their mothers that last through the breeding season.

In terms of their social behavior, red pandas tend to have a very limited interaction with other. This is particularly true during the breeding season when they are patchily distributed across their range.
